

# Horse Weigh's Sustainability Agenda

Every forward looking company, business, organization or entertainment operation, is now looking at themselves, to make sure that their operational model, is "fully aware and completely respectful of the environment, and it is therefore considered highly in the manufacturing and distribution of our weighing platforms."

## Horse Weigh® Key Sustainability Points

Huge reduction in carbon footprint, thanks to the high quality and long lasting components, therefore less requirement for making unnecessary Horse Weigh platforms from scratch.

No power source is required during the use of our weighing platforms. Once every 600-700 horses, only 3-4 hours are required for the unit to be fully recharged. Therefore our technology delivers a huge reduction in electric usage.

Our two units at Badminton Horse Trials 2023 had a combined age of 26 years, they had both been re-floored with our new green shade of Astroturf, all of which clearly demonstrates "how sustainable our manufacturing processes are."

Recycling and upgrading options, allowing older models to regain a new lease of life and therefore reducing the need for landfill.

Because of our proven product longevity, with some units even achieving an age of 18 years old, our weighing platforms provide consistent and reliable sustainability which we believe cannot be improved upon anywhere else.
